 **REDCap** **AUTO-CALCULATIONS**
Research Electronic Data Capture

From Equations to results!

Shehab Anwer

Aswan Heart Centre, Magdi Yacoub Heart Foundation
United Nations High Commissioner for Refugees

INTRODUCTION

Introduction

- Data entry forms
- Real-time calculations
- Do not excessively use on REDCap data collection instruments
 - *can slow down the webpages.*

Definitions

- Similar to constructing equations in spreadsheet processors
 - *Microsoft Excel.*
- Variable names are the construction unit in the equation
- [] brackets identify variables
- Follow the mathematical order of operations when
 - *or else your calculated results might end up being incorrect.*

Create an auto-calculated field

- Online Designer page
- Select *Calculated Field*
- Type the calculation into the *Calculation Equation* box.
- Validate and test the equation

Edit Field

You may add a new project field to this data collection instrument by completing the fields below and clicking the Save button at the bottom. When you add a new field, it will be added to the form on this page. For an overview of the different field types available, you may view the [Field Types video \(4 min\)](#).

Field Type:

Field Label [How to use Piping](#)

Calculation Equation [How do I format the equation?](#)

[Clear calculation](#)

Test calculation with a record:

Action Tags / Field Annotation (optional)

[Learn about Action Tags](#) or [using Field Annotation](#)

Variable Name (utilized during data export)

Enable auto naming of variable based upon its Field Label?

ONLY letters, numbers, and underscores

Required?* No Yes

* Prompt if field is blank

Identifier? No Yes

Does the field contain identifying information (e.g., name, SSN, address)?

Custom Alignment

Align the position of the field on the page

Field Note (optional)

Small reminder text displayed underneath field

Mobile Tel.

Expected results!

- **Can I create a calculation that returns text or a date as a result?**
 - *Sadly, NO!* **Only numbers.**

CODING AN EQUATION

The basics!

Basics of coding!

- Variables between brackets
 - *[variable]*
- Play with your basic math signs

- Add

- Subtract

- Multiply

- Divide

- Must be in the same event!

SCORING CALCULATIONS

Scoring from multiple answers

- You want to calculate certain score for risk factors.
 - *Out of 3!*
- Variables are labelled as:
 - *Smoking*
 - *Alcohol_Abuse*
 - *Obesity*
- It is based on summation of different answers that are translated to numerical value.
 - *Yes = 1*
 - *No = 0*
- Equation:
 - ***sum ([smoking],[alcohol_abuse],[obesity])***
 - *No spaces!*

Add New Field

You may add a new project field to this data collection instrument by completing the fields below and clicking the Save button at the bottom. When you add a new field, it will be added to the form on this page. For an overview of the different field types available, you may view the [🎥 Field Types video \(4 min\)](#).

Field Type:

Field Label

[📝 How to use Piping](#)

Risk factor score!

Calculation Equation [How do I format the equation?](#)

sum ([smoking],[alcohol_abuse],[obesity])

✓ Valid

[Clear calculation](#)

Test calculation with a record:

Action Tags / Field Annotation (optional)

[📌 Learn about Action Tags](#) or [using Field Annotation](#)

Variable Name (utilized during data export)

Enable auto naming of variable based upon its Field Label?

ONLY letters, numbers, and underscores

Required?* No Yes

* Prompt if field is blank

Identifier? No Yes

Does the field contain identifying information (e.g., name, SSN, address)?

Custom Alignment

Align the position of the field on the page

Field Note (optional)

Small reminder text displayed underneath field

Advanced scoring!

- Same applies if there is a grading – depends on choices label design code.
- Example:
 - Label Obesity as:
 - *No = 0*
 - *Over weight = 1*
 - *Obese = 2*
 - *Morbid obesity = 3*
- Then the equation will be calculated value as designed in the multiple choice field code.

The screenshot shows a configuration interface for a multiple choice question. At the top, the 'Field Type' is set to 'Multiple Choice - Radio Buttons (Single Answer)'. Below this, the 'Field Label' is 'Obesity'. The 'Choices (one choice per line)' section contains four options: '0, No', '1, Over weight', '2, Obese', and '3, Morbid Obesity'. There are links for 'How to use Piping' and 'Copy existing choices'. A link at the bottom asks 'How do I manually code the choices?'. On the right side, there are partial views of other configuration options like 'Value', 'Response', 'Identify', 'Custom', and 'File'.

Tips #1 ... 'Multiple Choice' Field type!

- For scoring, never use a multiple selection multiple choices field!
- Leave each score as simple and separate!

different field types available, you may view the [field types video \(4 min\)](#).

Field Type:	Multiple Choice - Radio Buttons (Single Answer) ▼
Field Label	---- Select a Type of Field ----
Obesity	Text Box (Short Text, Number, Date/Time, ...)
	Notes Box (Paragraph Text)
	Calculated Field
	Multiple Choice - Drop-down List (Single Answer)
	Multiple Choice - Radio Buttons (Single Answer)
	Checkboxes (Multiple Answers)
	Yes - No
	True - False
	Signature (draw signature with mouse or finger)
	File Upload (for users to upload files)
	Slider / Visual Analog Scale
Choices (one)	
0, No	
1, Over weight	
2, Obese	
3, Morbid Ob	

Conditional Values for equations

- If you need to numerically auto-classify a value.
- Example:
 - *If BMI more than 30, gives 1 as an answer.*

- ***if([bmi] > 30, 1, 0)***

- **if**(CONDITION, if condition is TRUE, if condition is FALSE)

button at the bottom. when you add a new field, it will be added to the table. For more information on the different field types available, you may view the [Field Types video \(4 min\)](#)

Field Type:

Field Label [How to use Piping](#)

Is patient obese?

Calculation Equation [How do I format the equation?](#)

if([bmi] > 30, 1, 0)

[Clear calculation](#)

Test calculation with a record:

Action Tags / Field Annotation (optional)

[Learn about Action Tags](#) or [using Field Annotation](#)

Variable Name:
ONLY letters, numbers, and underscores

Required?*
* Prompt if field is required

Identifier?
Does the field contain unique values?

Custom Alignment
Align the position of the field

Field Note (optional)
Small reminder text

Tip #2 ... Sum or Addition!

■ $\text{sum}([q1],[q2],[q3],[q4])$

- Sum of questions 1-4, even if one of the values is **blank**.
- Blank values or missing data will be ignored

■ $[q1]+[q2]+[q3]+[q4]$

- Sum of questions 1-4 but **only if** every question has a value.
- Blank values won't be ignored!
- **Allows secondary prevention of missing data in important equations!**

Common equations - BMI

- Original form:

$$\text{BMI} = \frac{\text{mass}(\text{kg})}{(\text{height}(\text{m}))^2}$$

- Translation to REDCap:

- *(**[weight]** / (**[height]** * **[height]**))*

- **Design tip:**

- ***Ensure units accuracy!***

DATE AND TIME

Dates and time!

- Basic Code:

- ***datediff([date1],[date2],"y")***

- Common, and more complex equations

- Example

- *Age*

- *Hospital stay*

- *Time between visits*

Design definitions!

```
datediff("today",[date_of_birth],"y", "dmy", true)
```

- Years **Y**
- Months **M**
- Days **D**
- Present time **Today**
- **Accuracy of date format**
 - *DMY, MDY*

Tip #3 ... Variable arrangement!

- Always make sure in subtraction or extraction equations that larger values comes first, to avoid false negative values!

```
datediff("today",[date_of_birth],"y", "dmy", true)
```

Tip #4 ... Returned Sign Value!

- Denotes calculating absolute value – either in positive or negative plan!
 - *"false"*
 - returns the absolute value of the difference (never negative, always a positive value)
 - *"true"*
 - Returns the actual value (either positive or negative)
- Example:
 - *if [date1] is larger than [date2], then the result will be negative if Return Signed Value is set to true. If Return Signed Value is not set or is set to false, then the result will ALWAYS be a positive number.*
- **Importance:**
 - ***Always set to true, to detect if any wrong date was entered!***
 - **Example 1-12-2008 instead of 1-12-2018**

Examples for time calculations

- **Age at enrolment:**

- ***`datediff([date_enrolled],[dob],"y", true)`***

- **Time between project start and recruitment**

- ***`datediff("01-02-2018",[dob],"m","dmy", true)`***

- **Current age**

- ***`datediff("today",[dob],"y", true)`***

A decorative blue L-shaped frame surrounds the text. It consists of a vertical bar on the left, a horizontal bar at the top, and another vertical bar on the right, with a horizontal bar at the bottom connecting them.

ADVANCED FUNCTIONS

And basic statistics on patients' timeline!

Round - Approximation

round('your equation')

- Returned values are **approximated** to nearest decimal
- E.g. if result = 34.6756, it will be rounded to **34.7**

Square root!

sqrt([*variable*] or 'your Equation')

- E.g. if variable value = 9, it will be **square rooted** to 3

Or

- **If you need a square root of a whole equation, enter it between brackets (and).**

Exponents

([variable]^'exponent')

Returned values are **exponential to certain value**

■ E.g. 3rd exponent of height

- ****([height]^(**3**))****

Minimum and Maximum values

min([v1],[v2],[v3],...)

max([v1],[v2],[v3],...)

Returned value is the **min/max value** of these variables.

e.g. outcomes from different visits – least weight patient recorded during his follow ups!

Mean value

mean([v1],[v2],[v3],...)

Returned value is the **mean** of these variables.

e.g. mean weight patient recorded during his follow ups!

Median value

median([v1],[v2],[v3],...)

Returned value is the **median** of these variables.

e.g. mean weight patient recorded during his follow ups!
