

UV BLOOD TREATMENT

for multidrug-resistant sepsis

● Concept

● Why

is this technology necessary?

Multidrug-resistant (MDR) sepsis causes high rates of morbidity and mortality in patients. Currently there are no effective sepsis-specific treatments for MDR cases.

Globally, there are **50 million** cases & over **11 million** deaths from sepsis every year

novel therapeutic device for an
unmet market need is currently under development

What ●

makes this technology unique?

This technology has the potential to offer an effective, alternative therapy to antibiotics for the treatment of sepsis. This solution will be increasingly important as rates of antibiotic resistance grow.
